NOVELTY - New methods for the analysis of compounds, particularly nucleic

acids, use a **solid support**, labeled compounds and **mass spectrometry**.

DETAILED DESCRIPTION - A novel method of making a **set** of **labeled** compounds, using of a support and a **set** of **labels**, comprises:

(1) at least one first or intermediate step comprising dividing the support into lots, performing a **different** chemical **reaction** on each lot of the support so as either to modify that lot of the support or to couple a chemical moiety to that lot of the support, tagging a fraction of each lot of the support with a **different label**, and combining the lots of the support, and

(2) at least one intermediate or final step comprising dividing the support into lots, performing a **different** chemical **reaction** on each lot of the support, so as either to modify that lot of the support or to couple a chemical moiety to that lot of the support, tagging a fraction of each lot of the support with a **different label**, where each **different label** is linked to a chemical moiety a labeled compound which is separable from the support, and combining the lots of the support.

INDEPENDENT CLAIMS are also included for the following:

(1) a **set** of **labeled** compounds where a molecule of a compound of the set is tagged with a single label which identifies the nature and/or the position of a component of that molecule, and different molecules of the same compound are tagged with **different labels**;

(2) a reagent comprising a **solid support** which carries on its surface molecules of an oligomer, with different oligomer molecules having the same sequence where the oligomer molecules include some shorter oligomer molecules and a shorter oligomer molecule carries a label which identifies the nature and position of a monomer unit of the oligomer molecule;

(3) a method comprising providing a labeled oligonucleotide (ON) or nucleic acid, and removing the label by cleavage to give a **charged species** which is subjected to **mass spectrometry** (MS);

(4) an assay method in which a labeled probe is partitioned into 2 fractions one of which is determined, the probe comprising a ligand joined to a label by a link which is cleavable to give a **charged species** for MS;

(5) a library of probes each comprising a ligand joined to a label by a link which is cleavable to give a **charged species** for analysis by MS, where each different probe has a **different label**;

(6) a compound of formula (I);

(7) an insert for use as a target for laser desorption ionization MS, which insert has a target surface of glass or of an organic polymer carrying an immobilized compound for analysis;

(8) a kit comprising a MS and a supply of inserts, for use as targets for laser desorption MS, having target surfaces of glass or of an organic polymer;

(9) a system for analyzing nucleic acids comprising:

(a) a **solid support** carrying an array of nucleic acids to act as targets for analysis or as probes to capture a target;

(b) ON reagents tagged with moieties suitable for analysis by MS;

(c) reagents and apparatus for biochemical procedures to allow specific interaction between the tagged ONs and the target;

(d) a device to introduce the samples into a MS, and
(e) a MS;

(10) a system for analyzing nucleic acids on a **solid support** comprising:

(a) components (a) - (c) as in (9);

- (b) a device to introduce the **solid support** into a MS, and
- (c) a MS;
- (11) an automated system for analyzing nucleic acids comprising:
- (a) ON reagents, tagged with moieties suitable for analysis by MS;
- (b) a MS;
- (c) a computer to carry out the analysis, and
- (d) software to interpret a mass spectrum;
- (12) a nucleotide or ON labeled with a tag suitable for analysis by MS, the labeled nucleotide or ON being suitable for enzymatic incorporation, where the tag is a compound of formula (I) without the proviso:
- R1R2R3CY (I)
- Y = a leaving group for reaction with a nucleophilic species, and
- R1, R2 and R3 = same or different and each is a monocyclic or fused ring aromatic group, at least one of which carries a substituent selected from 1-20C alkoxy or hydrocarbyl optionally substituted by carboxylic acid, sulfonic acid, nitro, cyano, hydroxyl, thiol, primary, secondary or tertiary amino, primary or secondary amido, anhydride, carbonyl halide, or active ester; provided that R1, R2 and R3 together carry at least 2 amide groups and/or at least 2 N-hydroxysuccinimide ester groups.
- USE - The methods and products are used for the analysis of chemical compounds, particularly nucleic acid molecules.
- ADVANTAGE - None given.
- Dwg. 0/8

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Using nonvolatile, releasable, mass-labels, the present invention provides for the synthesis and use of mass-labeled compounds to specifically interact with biomolecular targets. Following binding of the mass-labeled compounds to the target molecule, the unique mass-label can be analyzed using **mass spectrometry** to identify and characterize the target molecule. In one embodiment of the invention, a mass-labeled oligonucleotide probe is used to identify a specific gene sequence. A myriad of mass-labeled compounds may be produced for use in a wide variety of interactions such as oligonucleotide-oligonucleotide hybridization, polynucleotide-polynucleotide interactions, enzyme-substrate or substrate analog/intermediate interactions, polypeptide-nucleic acid interactions, protein-ligand interactions, receptor-ligand interactions, polypeptide-metal interactions, nucleic acid-metal interactions or antigen-antibody interactions. Also contemplated are combinatorial

09567863

processes for creating large libraries of compounds permitting rapid screening for a wide variety of targets.

AB The present invention relates to compositions and methods for the detection and characterization of nucleic acid sequences and variations in nucleic acid sequences. The present invention relates to methods for forming a nucleic acid cleavage structure on a target sequence and cleaving the nucleic acid cleavage structure in a site-specific manner. For example, in some embodiments, a 5' nuclease activity from any of a variety of enzymes is used to cleave the target-dependent cleavage structure, thereby indicating the presence of specific nucleic acid sequences or specific variations thereof.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Compositions and methods for the therapy and diagnosis of cancer,
particularly colon cancer, are disclosed. Illustrative compositions
comprise one or more colon tumor polypeptides, immunogenic portions
thereof, polynucleotides that encode such polypeptides, antigen
presenting cell that expresses such polypeptides, and T cells that are
specific for cells expressing such polypeptides. The disclosed
compositions are useful, for example, in the diagnosis, prevention
and/or treatment of diseases, particularly colon cancer.

AB The present invention provides C. neoformans genes that are essential and are potential targets for drug screening. The nucleotide sequence of the target genes can be used for various drug discovery purposes, such as expression of the recombinant protein, hybridization assay and construction of nucleic acid arrays. The uses of proteins encoded by the essential genes, and genetically engineered cells comprising modified alleles of essential genes in various screening methods are also encompassed by the invention. The present invention also provides methods and compositions that enable the experimental determination as to whether any gene in the genome of Cryptococcus neoformans is essential, and whether that gene is required for virulence or pathogenicity. The identification of essential genes and those genes critical to the development of virulent infections, provides a basis for the development of screens for new drugs against C. neoformans.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention provides improved monooxygenases, dehydrogenases, and transferases that are useful for the biocatalytic synthesis of compounds such as α -hydroxycarboxylic acids, and aryl- and alkyl-hydroxy compounds. The polypeptides provided herein are improved in properties such as regioselectivity, enzymatic activity, stereospecificity, and the like. Methods for obtaining recombinant polynucleotides that encode these improved polypeptides are also provided, as are organisms that express the polypeptides and are thus useful for carrying out said biocatalytic syntheses. Also provided by the invention are methods for increasing said solvent resistance of organisms that are used in the synthetic methods.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Using nonvolatile, releasable, mass-labels, the present invention provides for the synthesis and use of mass-labeled compounds to specifically interact with biomolecular targets. Following binding of the mass-labeled compounds to the target molecule, the unique mass-label can be analyzed using **mass spectrometry** to identify and characterize the target molecule. In one embodiment of the invention, a mass-labeled oligonucleotide probe is used to identify a specific gene sequence. A myriad of mass-labeled compounds may be produced for use in a wide variety of interactions such as oligonucleotide-oligonucleotide hybridization, polynucleotide-polynucleotide interactions, enzyme-substrate or substrate analog/intermediate interactions, polypeptide-nucleic acid interactions, protein-ligand interactions, receptor-ligand interactions, polypeptide-metal interactions, nucleic acid-metal interactions or antigen-antibody interactions. Also contemplated are combinatorial processes for creating large libraries of compounds permitting rapid screening for a wide variety of targets.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention relates to novel human secreted proteins and isolated nucleic acids containing the coding regions of the genes encoding such proteins. Also provided are vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The invention further relates to diagnostic and therapeutic methods useful for diagnosing and treating diseases, disorders, and/or conditions related to these novel human secreted proteins.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides methods and compositions that enable the experimental determination as to whether any gene in the genome of a diploid pathogenic organism is essential, and whether it is required for virulence or pathogenicity. The methods involve the construction of genetic mutants in which one allele of a specific gene is inactivated while the other allele of the gene is placed under conditional expression. The identification of essential genes and those genes critical to the development of virulent infections, provides a basis for the development of screens for new drugs against such pathogenic organisms.

The present invention further provides Candida albicans genes that are demonstrated to be essential and are potential targets for drug screening. The nucleotide sequence of the target genes can be used for various drug discovery purposes, such as expression of the recombinant protein, hybridization assay and construction of nucleic acid arrays. The uses of proteins encoded by the essential genes, and genetically engineered cells comprising modified alleles of essential genes in various screening methods are also encompassed by the invention.

AB The DNA sequencing apparatus contains the following components. A first reaction vessel contains a reaction chamber into and out of which can be transferred reagents, reactants and reaction products. A device for separating individual oligonucleotides and polynucleotides on the basis of length, such as an electrophoretic unit, receives reaction products from the first reaction vessel. A second reaction vessel is designed for oxidizing pentose sugars. It comprises a reaction chamber having a device for transferring reactants and reagents into the reaction chamber and gaseous by-products of a reaction out of the reaction chamber. Separated oligonucleotides and polynucleotides can be selectably transferred from the separating device alternatively into the first or the second reaction vessel. The device also includes a second transfer device for transferring the gaseous by-products out of the second reaction vessel and a collection chamber for collecting the gaseous by-products. The collection chamber is in communication with the second transfer device. Finally, the apparatus contains an analyzer for analyzing the relative abundance of the components of the gaseous by-product by mass such as a **mass spectrometer**, the analyzer being in communication with a transfer device for transferring gaseous by-products from the collection chamber to the analyzer.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A method of determining the nucleotide sequence of a DNA molecule of arbitrary length as a single procedure by sequencing portions of the molecule in a fashion such that the sequence of the 5' end of the succeeding contiguous portion is sequenced as the 3' end of its preceeding portion is sequenced, for all portions, where the order of contiguous portions is determined by the sequence of the DNA molecule. Sequencing of the individual portions is accomplished by generating a family of polynucleotides under conditions which determine that the elements are partial copies of the portion and are of random nucleotide length on the 3' and 5' ends about a dinucleotide which is an internal reference point; determining the base composition and terminal base identity of each element of the family and solving for the sequence by a method of analysis wherein the base composition and terminal base data of each element is used to solve for a single base of the sequence by assigning the base to either the 5' or 3' end of the partial sequence about the internal reference point as the entire sequence of the portion is built up from a dinucleotide.
